ASP.NET

CAS can be used with ASP.NET by using Forms Authentication.

- Download the client library from http://login.iiit.ac.in/help/files/CASClient.zip [http://login.iiit.ac.in /help/files/CASClient.zip].
- Replace Login.aspx, Login.aspx.cs and Login.aspx.Designer.cs with the files provided in the zip package. Also add CAS.cs and CAS.xsd files provided to the project. *(For .NET 3.5 and less, CAS.cs will go into special ASP.NET folder App_Code)*
- Update the namespace in the cs and aspx files to match that of your project.
- Update the web.config file to use Login.aspx for Forms authentication

You can update the Exception handler in Login.aspx.cs to have custom error page if CAS fails to validate. Else, implement /Error.aspx to provide user with useful error page.

To logout the user from the application as well as CAS, call:

```
FormsAuthentication.SignOut();
Response.Redirect("https://login.iiit.ac.in/cas/logout");
```
